

1: HTML5, CSS3 (Version 1)

Required software:

- Web browser: Internet Explorer/...
- HTML editor: Notepad/...

Exercise 1:

Create an HTML document containing a table representing student attendance, following the model below:

Student ID	Last Name	First Name	Course	Session date	
				Present	Participated

Each row of the table should contain the information of one student.

Exercise 2:

Create a web page containing a form to add a new student to a group with the following fields:

- Student ID
- Last Name
- First Name
- Email

The form must also include a "Submit" button to send the new student's information to the system.

Exercise 3:

Create a web page containing a navigation bar (navbar) for the attendance system. The navigation bar should include at least the following links:

- Home
- Attendance List
- Add Student
- Reports
- Logout

Exercise 4:

1. Do a quick search and explain what the Mobile First approach is. Why is it useful? What are best practices when designing mobile-first?
2. Design the web pages created in the previous exercises using the Mobile First approach.
 - Start by designing for small screens (smartphones), then progressively adapt the layout for tablets and desktops using CSS media queries.
 - Ensure that the table, form, and navigation bar remain readable and well-structured on all devices.

Exercise 5:

- List and briefly explain the main steps of the Software Development Life Cycle (SDLC).
- Define the website's purpose, target audience, and desired functionalities.
- Who are the main users (actors) of the system?
